What's New In SmartDrive?

Local Fixed Disk is a free and open source utility that can be used to keep track of and manage information on the drives and media attached to your computer. It is mainly aimed at desktop users, although it can be used on mobile devices as well. The program's name is a reference to the first letters of the "local", "file system" and "fixed disk" names, that can be seen in Windows Explorer. The application gathers information on device attributes like drive name, available space, media type and error code, and it can be configured to access selected drives on a regular basis. The main window features a list of drives, divided into three columns: Name, Media Type and Last Error Code. All of the drives show the attributes as seen in the image below. The drive name is also displayed at the bottom of the window, which is similar to the "disk" icon used in Windows Explorer. Since most of the time is spent on the drives, it is possible to access drive attributes by pressing the Display button on the right-hand side of the window. This allows you to access the Get information on the selected drive and the reset buttons, as well as the Refresh button in the bottom-right corner. These buttons can be used to request the selected drive's attributes at a regular basis, or to access the file system and media types from a flash or hard disk. As these options require more processing power, the application warns the user if the CPU usage is going above 20%. Local Fixed Disk does not include a power management option, although it does warn the user when there is a high or low battery charge on the selected drives. Instead, you can access the On Battery status directly from the main window. The main window features two buttons: One is used to toggle between the current and the previous versions of the software, while the other shows or hides the drive name. The application also includes a button with the drive name, which can be used to copy the drive name to the Clipboard. As the main window has three different areas, Local Fixed Disk offers a versatile interface for finding and accessing drives. The power management options are displayed by clicking the button in the bottom-right corner of the main window. This allows the user to find and reset the selected drives' power settings, as well as to access the On Battery status. In addition, there are four options that can be used to get information on the selected drives. The first option can be used to display or hide the drive name on the button at the top right of the window. The second option is used to display or hide the power management options. The third and fourth options can be used to access or reset the selected drives' power settings and On Battery status. Local Fixed Disk is a low memory and CPU eater, which may cause the system to hang or crash when heavy processing is involved
